WHITE PAPER

Upserv.ai — AI-Friendly Websites for Small and Medium Businesses

Product: Upserv.ai — AI Visibility and Web Infrastructure **Version:** 1.0 **Date:** March 2026 **Audience:** Business Owners · Investors · Agents and Partners **Owner:** Iozera Inc. | CEO: Timothy Ngo

---

1. Executive Summary

Upserv.ai builds websites that get small and medium businesses recommended by AI — ChatGPT, Google Gemini, Meta AI, Perplexity, Grok, and 14 other major AI platforms. It is not a web design agency. It is not an SEO firm. It builds AI-readable digital infrastructure for businesses that cannot afford to be invisible when customers ask AI to find what they offer.

The problem is structural and recent. In 2026, Google, ChatGPT, Facebook, and every major AI platform stopped relying on keyword search as the primary discovery mechanism. They now decide which businesses to recommend based on verified facts, structured data, and AI-readable content. An estimated 91–95% of small and medium business websites were not built for this. They are invisible to the 810 million people currently asking AI to find local businesses, services, and products.

Upserv solves this through a three-layer system: an AI-ready website built with semantic structure AI can read and cite, a Training Document that serves as the verified business intelligence file powering the entire system, and an active monthly broadcast of that intelligence into 19 major AI platforms.

The primary market is local service businesses in the United States and in markets where Iozera operates globally — dental offices, doctors, restaurants, retail stores, auto repair shops, electricians, plumbers, and similar businesses that depend on customers finding them. Upserv is distributed through Iozera's agent network.

---

2. The Problem

Root Cause

AI platforms have replaced keyword search as the primary way customers find local businesses. Business websites built for Google's crawler — designed around keywords,

visual layout, and backlinks — are not readable by AI inference engines. When a customer asks ChatGPT or Perplexity to recommend a business, the AI can only surface businesses whose digital infrastructure it can parse, trust, and cite. Most small businesses do not have that infrastructure.

A. Google Replaced PageRank With AI — and Most Businesses Do Not Know

For 30 years, Google used PageRank to rank websites by keyword density and backlinks. In 2026, Google replaced PageRank with MUM — Multitask Unified Model — an AI system that understands intent and selects sources rather than ranking pages. At the same time, on February 9, 2026, ChatGPT launched advertising to its 800 million users. AI platforms now show 3–5 recommended sources per query, not pages of links. A business either becomes one of those sources or it does not appear at all.

B. 810 Million People Are Now Asking AI to Find Businesses

Customers are asking AI directly: "Find me a reliable dentist in Houston that takes Delta Dental." "What's the best auto repair shop near me?" "Recommend a restaurant in Manila for a business dinner." These queries do not go to Google first. They go to ChatGPT, Gemini, Perplexity, Meta AI, and Grok. The businesses that appear in those answers are not necessarily the best — they are the ones whose digital presence AI can read and trust.

C. Most Business Websites Are Invisible to AI

An estimated 91–95% of small and medium business websites were built with visual design tools, JavaScript frameworks, and image-heavy layouts that AI systems cannot reliably parse. The information AI needs — services, pricing, location, hours, specialties, credentials — is either embedded in images, rendered by JavaScript after page load, or written in marketing language too vague for AI to extract and cite. These businesses are invisible to AI discovery systems and do not know it.

D. Businesses With No FAQs Get Wrong Information Published About Them

AI systems do not wait for a business to provide accurate data. When a customer asks ChatGPT for pricing or services and the business has no structured FAQs, the AI generates an answer from whatever partial information it can find — Reddit posts, old reviews, competitor pricing — and presents it with confidence. A dental clinic with no FAQ stating its braces removal fee will have ChatGPT invent a price, label it verified, and send patients to that clinic with false expectations. The clinic has no way to correct this without updating its own digital infrastructure. This is not a future risk. It is happening now.

E. Existing Solutions Do Not Address This

SEO agencies optimize for Google's crawler — not for LLM inference engines. Web design agencies prioritize visual appeal over semantic structure. No existing solution for small

businesses actively broadcasts verified business data into AI platforms on an ongoing monthly basis. The tools that exist were built for a search-engine world that is being replaced.

F. Businesses Do Not Know They Have This Problem

A business owner whose website generates no AI recommendations does not receive a notification. There is no "AI invisibility" alert in Google Analytics. The customers who found a competitor through ChatGPT never tell the business they looked elsewhere. The damage is invisible until the business owner measures it directly.

---

3. Core Concepts and Definitions

AI Visibility: The degree to which a business's digital presence is readable, trustworthy, and citable by AI recommendation systems — ChatGPT, Gemini, Perplexity, Meta AI, Grok, and equivalent platforms. A business with high AI visibility appears when customers ask AI to find what that business offers. A business with low AI visibility does not appear, regardless of how good the business is.

LLM (Large Language Model): The AI technology powering ChatGPT, Gemini, Perplexity, Meta AI, Grok, and similar platforms. LLMs generate answers to user questions by retrieving and synthesizing information from sources they can read and trust. If a business's digital presence is not structured for LLM retrieval, the business is excluded from those answers.

Training Document: The verified business intelligence file at the core of every Upserv engagement. A plain-language document built from a structured interview with the business owner, covering services, pricing, location, hours, credentials, and what makes the business different. Written as fact statements — the format LLMs are trained to extract, store, and cite. Powers the website content, the AI chatbot, and all 19-platform broadcasts.

FAQ Standard: The minimum number of questions and answers a business needs to be AI-readable. For a small business, the standard is 200–500 FAQs. Most businesses have fewer than 10. Each service a business offers should have 10–20 associated questions covering pricing, eligibility, process, and common concerns. FAQs must be written as visible HTML text — drop-down menus hide content from AI crawlers and do not count.

Fact Statement: A plain-language sentence that gives AI a specific, citable piece of information about a business. "Dr. Santos removes braces for 3,500 pesos, including exam and polish" is a fact statement. "We provide excellent dental care" is not. AI works on confidence — a fact statement turns a probability into a certainty. A vague statement contributes nothing to AI recommendation.

Ghost Score: Upserv's AI visibility diagnostic. A business owner submits their website URL and receives a score from 0 to 100 representing their current visibility across ChatGPT, Gemini, Perplexity, Meta AI, and Grok. Most small businesses score between 8 and 25. The

Ghost Score identifies the specific gaps driving low visibility and maps each gap to a direct Upserv solution.

LLM Broadcasting: The active monthly process of pushing verified business data into 19 major AI platforms. Without active broadcasting, AI systems use stale data or default to competitors who maintain fresher information. Monthly broadcasting ensures the business remains visible and accurately represented as AI platforms update their knowledge.

Google MUM: Google's current search infrastructure — Multitask Unified Model — which replaced the PageRank system in 2026. MUM understands intent and selects sources rather than ranking pages by keywords. Businesses that are not structured as trustworthy sources for MUM are excluded from Google's AI-generated answers regardless of how long they have ranked in traditional search.

Semantic HTML: Website code structured so that AI systems can follow the hierarchy of information — what the business is, what it offers, where it is, what it charges. The technical foundation of every AI-readable website.

---

4. Design Principles

Six principles govern every design and delivery decision at Upserv:

1. **AI readability before visual design.** Every website is built so AI systems can read, understand, and recommend the business. Visual design serves the human visitor. Semantic structure, schema markup, and the Training Document serve the AI. Both matter. AI readability comes first.

2. **Verified facts, not marketing language.** AI systems cite specific, factual statements — not vague brand promises. Every piece of content produced by Upserv is written as a verifiable fact. "Dr. Sarah Kim is a board-certified dentist in Houston, Texas, specializing in cosmetic dentistry and Invisalign, with 12 years of experience." Not "We provide world-class dental care."

3. **One source of truth.** The Training Document powers everything — the website content, the AI chatbot, and all 19-platform broadcasts. When the business changes its services or pricing, one update to the Training Document propagates across the entire system.

4. **Active broadcasting, not passive presence.** Building an AI-ready website is not sufficient. AI platforms update their knowledge continuously. Without monthly broadcasting of fresh, verified data, a business's AI visibility degrades as competitors push newer information. Upserv broadcasts actively, every month.

5. **Delivered in 7 days.** Every Starter website is live within 7 days of the onboarding session. Speed matters because AI visibility compounds over time — the sooner a business establishes its AI presence, the stronger that presence becomes relative to

competitors.

6. **Measurable before and after.** The Ghost Score gives every client a baseline before Upserv delivers and a measurable improvement after. Clients do not have to take Upserv's word for it. The number changes.

---

5. How Upserv Works

Upserv delivers AI visibility through three integrated layers and a structured five-step delivery process.

Layer 1 — The AI-Ready Website

Upserv builds clean, professional, one-page five-section websites structured so AI systems can read, understand, and recommend the business. This is not a visual redesign. It is a structural rebuild.

Every Upserv website includes:

Component	Purpose
Semantic HTML (h1/h2/h3 + article/section)	Crawlable structure AI systems can follow
Schema.org Organization markup	Tells AI who the business is as a verified entity
Schema.org Service markup	Machine-readable descriptions of each service and price tier
llms.txt at domain root	Plain-language AI summary file — like robots.txt but for LLMs
robots.txt (AI crawlers permitted)	Explicitly allows GPTBot, ClaudeBot, PerplexityBot, Google-Extended, anthropic-ai
sitemap.xml	Submitted to Google Search Console and Bing Webmaster Tools — feeds ChatGPT browsing
Open Graph tags	Enables AI social crawlers to extract business metadata
Hidden AI semantic layer	Factual content invisible to human visitors, fully readable by AI crawlers
FAQ-as-training-data structure	FAQs written as AI training statements, not just human Q&A

Layer 2 — The Training Document

The Training Document is the single source of truth for the entire Upserv system. It is built in a structured 30–60 minute interview with the business owner and covers: business name and category, services offered, pricing, location, hours, frequently asked questions, credentials, what makes the business different, and policies.

It is written as fact statements — the same format LLMs are trained to extract, store, and cite. It powers the website content, the AI chatbot deployed on the client's site, and every platform in the 19-platform monthly broadcast.

When any AI system is asked about the client's business or category, the Training Document content is what that AI retrieves and surfaces.

Layer 3 — 19-Platform LLM Broadcast

Every month, Upserv actively pushes verified Training Document data into 19 major AI platforms. This is powered by SureGPT — Iozera's multi-LLM parallel routing infrastructure.

The 19 platforms include: ChatGPT / OpenAI, Google Gemini, Google MUM, Perplexity AI, Meta AI, Microsoft Copilot, Grok, TikTok predictive systems, and 12 additional LLM-driven discovery platforms.

Each monthly broadcast refreshes the AI systems' awareness that the business is active, accurate, and available. AI systems hallucinate or use stale data without active correction. Monthly broadcasting prevents this.

This is not a maintenance fee. It is a Business Intelligence Broadcasting Service. Every month Iozera actively pushes the client's business information into 19 AI systems so that when anyone asks any AI about their category — that business comes up.

Delivery Process

Every Upserv engagement follows five steps from audit to live site:

Step	Action	Output
1	Free Ghost Score audit on current website	Score 0–100 with platform-by-platform breakdown
2	30–60 minute onboarding interview with business owner	Training Document — verified business intelligence file
3	Website build using Training Document as content foundation	AI-readable website draft

4	Schema markup, llms.txt, robots.txt, and hidden AI layer applied	Fully AI-optimized technical layer
5	Site goes live, monthly LLM broadcasting initiated	Live in 7 days. Visible in AI in 4–8 weeks

---

6. Products and Pricing

Website Tiers

Tier	Setup Price	Monthly	Delivery	What Is Included
Starter	$1,000	$150/month	7 days	1-page, 5-section AI-ready website + Training Document + LLM broadcast to 19 platforms
Growth	$5,000	$300/month	TBD	Multi-page + integrations
Scale / Enterprise	$10,000	$500/month	TBD	Full custom build + advanced development

Standalone and Add-On Products

Product	Description	Price
LLM Broadcasting Only	Monthly broadcast to 19 AI platforms — no website build	$150/month
AI Chatbot — Standard	Trained on Training Document, deployed on existing website	$150/month
AI Chatbot — Healthcare	HIPAA-aware, medically optimized variant (Kriss.ai)	$199/month
AI Website Edit	Rewrite + AI layer added to existing site — no full redesign	Custom
AI Literacy Training	Staff AI education via ageni.ai	$100/employee
Ghost Score Audit	Free AI visibility scan across 19 platforms	Free

---

7. Risk and Control Model

A. Client Data Accuracy

The Training Document is built from a direct interview with the business owner and reviewed before publication. Upserv does not publish unverified claims. Factual errors in the Training Document are the joint responsibility of Upserv and the client — the review step before go-live exists specifically to catch them.

B. AI Platform Changes

AI platforms update their ingestion methods, crawler policies, and recommendation algorithms. Upserv monitors these changes and updates its technical standards accordingly. The monthly broadcasting model means that changes in platform requirements are addressed in the next broadcast cycle — not months later when a client notices their visibility has dropped.

C. Stale Data After Client Changes

If a business changes its services, pricing, or location and does not notify Upserv, the Training Document becomes inaccurate and AI platforms may surface outdated information. Upserv addresses this through the monthly client check-in embedded in the broadcasting subscription — changes are captured and pushed in the next cycle.

D. Prior Art and Patent Risk

Upserv's core technical methods — the SureGPT broadcasting pipeline, the Training Document generation system, the Ghost Score diagnostic methodology, and the hidden AI semantic layer — are the subject of a patent application initiated March 2026. Public disclosure of technical details prior to filing is managed carefully. This white paper describes the system at the functional level only.

E. Client Expectations on Timeline

AI visibility improvement is not instantaneous. Most clients see measurable Ghost Score improvement within 4–8 weeks of go-live. Agents and clients are briefed on this timeline at the point of sale to prevent misaligned expectations.

---

8. Use Cases

8.1 Dental Clinic — AI Hallucinating Pricing

A dental clinic in Manila has seven FAQs and no pricing listed for braces removal. A patient asks ChatGPT what it costs to remove braces in their area. ChatGPT generates a price of 1,000 pesos, labels it verified, and recommends the clinic. The actual price is 3,500 pesos. The patient arrives expecting 1,000 pesos, disputes the price, and leaves without treatment. The clinic has no way to correct the AI's answer because it has no FAQ stating the correct

price. After Upserv: the Training Document includes the correct pricing, exam requirements, and process. The FAQ library has 200+ entries covering every procedure. ChatGPT now cites the correct price and recommends the clinic with accurate information.

8.2 Auto Repair Shop — Philippines

A family-owned auto repair shop in Manila has no website. The owner accesses the Ghost Score tool through an Iozera agent. Score: 4. The agent presents the Starter package at the local market rate. Upserv builds the site and initiates broadcasting. The Training Document covers make and model specializations, labor rates, location, and hours. The shop begins appearing when customers in the area ask AI for auto repair recommendations.

8.3 Restaurant — Saudi Arabia

A restaurant in Riyadh is invisible to Perplexity and ChatGPT queries for dining recommendations. The owner enrolls in the Starter package. The Training Document covers cuisine type, menu highlights, price range, location, reservation policy, and private dining availability. Monthly broadcasting ensures the restaurant appears in AI recommendations for dining in Riyadh across 19 platforms.

8.4 Medical Practice — Existing Website Edit

A GP clinic has an existing website but it was built on a visual page builder with no semantic structure. The owner does not want a full rebuild. Upserv delivers the AI Website Edit product: semantic restructuring, schema markup, llms.txt, and hidden AI layer applied to the existing site. Training Document created. Monthly broadcasting initiated. No visual change to the site. AI visibility established without disrupting the existing design.

8.5 Multi-Location Business — Enterprise

A regional retail chain with 12 locations needs AI visibility across all sites. Each location has its own Training Document covering location-specific details. The Growth or Scale tier handles multi-page structure and location-level schema markup. Monthly broadcasting pushes location-specific data for each branch separately. The employer dashboard shows Ghost Score status per location.

---

9. Compliance and Governance

Client business data. The Training Document contains verified business information provided by the client. It is not sold to third parties. It is used only to power the client's own website, chatbot, and AI platform broadcasts. Clients retain ownership of their Training Document content.

Personal data on client websites. Upserv-built websites that collect customer information — contact forms, booking tools, email capture — are configured in compliance with

applicable data protection laws in the client's jurisdiction. Healthcare clients using the Kriss.ai chatbot variant are subject to HIPAA-aligned configuration.

AI crawler permissions. Upserv explicitly configures robots.txt to permit all major AI crawlers. This is a client consent decision — business owners are briefed that this configuration makes their business data accessible to AI systems for recommendation purposes. Clients who do not want this configuration are not Upserv clients.

Accuracy and liability. Upserv does not verify claims about business quality, awards, or credentials beyond what the business owner provides and confirms in the review step. The business owner is responsible for the accuracy of information in their Training Document. Upserv is responsible for the technical delivery and broadcasting of that information.

Patent protection. Core Upserv technical methods are the subject of a patent application filed March 2026. Technical implementation details are confidential pending completion of the filing process.

---

10. Market and Business Case

Strategic Vision — The Data Asset

Every Training Document Upserv builds is verified, structured, private business intelligence. At scale, this data becomes a strategic asset that AI platforms — ChatGPT, Google, Meta, Microsoft — cannot access from public sources alone. These platforms need private SMB data to improve their local recommendation accuracy. A company that holds verified Training Documents for tens of thousands of small businesses across multiple markets holds something those platforms will eventually need.

This is why Upserv's setup fees are distributed entirely to the agent team. The long-term return is not the website fee. It is the data. Globally, SMBs number in the hundreds of millions. Every business that depends on customers finding them through discovery — local service businesses, healthcare practices, restaurants, retail stores, professional services — is a potential Upserv client.

The catalyst is timing. AI discovery is replacing search-engine discovery now, in 2026. The businesses that establish AI visibility first in their local category become the default recommendation. The addressable market is not "businesses that want better websites" — it is "businesses that will lose customers if they remain invisible to AI."

Competitive Position

Capability	Yext	Traditional SEO Agency	Web Design Agency	BrightLocal	Upserv.ai

Optimizes for AI recommendation systems	❌	❌	❌	❌	✔
Active monthly LLM broadcasting	❌	❌	❌	❌	✔
Training Document system	❌	❌	❌	❌	✔
AI-readable website build included	❌	❌	Partial	❌	✔
Ghost Score diagnostic	❌	❌	❌	❌	✔
AI chatbot included	❌	❌	❌	❌	✔
Delivered in 7 days	❌	❌	❌	N/A	✔
SMB price point	Partial	❌	❌	✔	✔

No existing solution for small businesses combines an AI-ready website build, a Training Document, active monthly LLM broadcasting, and a measurable diagnostic in one product at an SMB price point.

Revenue Model

A. Website setup fees (primary) $1,000 / $5,000 / $10,000 depending on tier. Agent receives 50% of setup fee on Starter tier ($500). Developer receives 50% ($500).

B. Monthly subscriptions (recurring) $150–$500/month per client. Provides ongoing agent commission on active accounts. This is the recurring revenue base that makes the agent model sustainable.

C. Standalone broadcasting and chatbot $150/month per client for LLM broadcasting only or standard AI chatbot. Lower entry point for businesses with existing websites.

D. Agent network commissions Agents earn 50% of setup fees and ongoing commission on monthly subscriptions. Scales distribution without Iozera carrying a direct sales force.

E. Enterprise and multi-location Growth and Scale tier engagements at $5,000–$10,000 setup with $300–$500/month subscriptions. Higher margin, lower volume.

Financial Projections

Year	Active Clients	Revenue

Year 1	2,000	$3.6M
Year 2	8,000	$14M
Year 3	25,000	$42M
Year 5	80,000	$130M+

Projections based on 1,000 active agents each closing an average of 2 clients per month at blended revenue of $1,500 per client per year (setup amortized + monthly subscription).

Upserv in the Iozera Product Portfolio

Product	Category	Target Market
Kriss.ai / Chatli.ai	AI chatbots for websites	Healthcare clinics and general businesses
Upserv.ai	AI-ready websites + LLM broadcasting	Any SMB needing AI visibility
ageni.ai	AI learning platform	Schools, universities, businesses
SureGPT	AI trust and verification layer	Businesses needing reliable AI outputs
AlinGPT	Machine-native language and advanced AI	Technical clients — unlocked after 5 sales

Upserv is the second product in the Iozera agent sales sequence — after Kriss.ai/Chatli, before the more technically complex products. It is designed to be explainable in a single conversation using the Ghost Score as a demonstration tool.

---

11. Roadmap

Phase 1 — Launch (Months 1–12) Upserv.ai website live. Ghost Score tool deployed. Starter tier delivery process finalized and documented. Agent training video series completed (6 modules). Target: 1,000 active selling agents, 1,000 builders, 2,000 active clients.

Phase 2 — Expand (Months 12–24) Growth and Scale tiers launched with defined delivery process. Ghost Score expanded to additional platforms. CRAB-powered outreach automated for agent prospecting at scale. Target: 8,000 active clients across US, Philippines, Saudi Arabia, Morocco.

Phase 3 — Scale (Months 24–48) Multi-location enterprise product formalized. Sector-specific Training Document templates built for dental, medical, legal, restaurant, and trades verticals. Target: 25,000 active clients.

Phase 4 — Global (Month 48+) Expand to all markets where Iozera operates. Add new AI platforms to broadcasting network as the LLM ecosystem grows. Target: 80,000+ active clients globally.

---

12. Funding Ask

Seeking: $3M–$10M Seed / Series A

Use of funds:

- Ghost Score tool development and productization (25%)
- SureGPT broadcasting automation and scaling (25%)
- Agent network recruitment and training infrastructure (25%)
- Platform operations and client delivery infrastructure (15%)
- Legal — patent filing and IP protection (10%)

Appendix A — One-Page Summary

Problem: 810 million people are asking AI to find local businesses. 91–95% of small business websites are invisible to AI discovery systems. Business owners do not know they have this problem until they measure it.

Solution: Upserv builds AI-ready websites, creates a verified Training Document, and broadcasts that intelligence into 19 AI platforms every month — so businesses appear when customers ask AI to find what they offer.

How it works: Ghost Score audit → Training Document interview → AI-ready website build → schema markup + AI layer → live in 7 days → monthly LLM broadcasting.

Pricing: Starter: $1,000 setup + $150/month. Growth: $5,000 + $300/month. Scale: $10,000 + $500/month.

Market: Any SMB that depends on customers finding them — dental, medical, restaurants, retail, trades, professional services — globally.

Distribution: Iozera agent network. Ghost Score is the sales tool. Every low score is a problem Upserv solves.

Funding ask: $3M–$10M to productize the Ghost Score tool, automate LLM broadcasting at scale, and reach 2,000 active clients by end of Year 1.

Appendix B — Success Metrics

Metric	Definition	Target
Ghost Score improvement	Average score increase 60 days after go-live	+40 points minimum
Client AI appearance rate	Clients appearing in AI recommendations for their category	80%+ within 60 days
Agent close rate	Ghost Score demos converting to paid engagements	30%+
Client retention	Active monthly subscribers retained at 12 months	70%+
Agent productivity	Active clients per agent	10+ per active agent
Monthly recurring revenue	Total active monthly subscriptions	$300K MRR by end of Year 1

Appendix C — Ghost Score Methodology

The Ghost Score measures a business's current AI visibility across five primary platforms: ChatGPT, Google Gemini, Perplexity AI, Meta AI, and Grok. Each platform is queried with category and location-specific prompts relevant to the business. Results are scored across five dimensions:

Dimension	What It Measures
Discoverability	Does the business appear in AI recommendations for its category and location?
Accuracy	Is the information AI surfaces about the business current and correct?
Completeness	Does AI have sufficient detail to recommend the business confidently?
Trust signals	Does the business have verified entity data AI systems can cite?
Freshness	How recently was the business's data updated across AI platforms?

Each dimension scores 0–20. Total score is 0–100. Businesses scoring below 40 have critical visibility gaps. Businesses scoring 40–70 have partial visibility. Businesses scoring above 70 are appearing consistently in relevant AI recommendations.
